# SENDGRID INTEGRATION WITH PYTHON CODE

TEAM ID	PNT2022TMID38573
PROJECT NAME	NUTRITION ASSISTANT APPLICATION

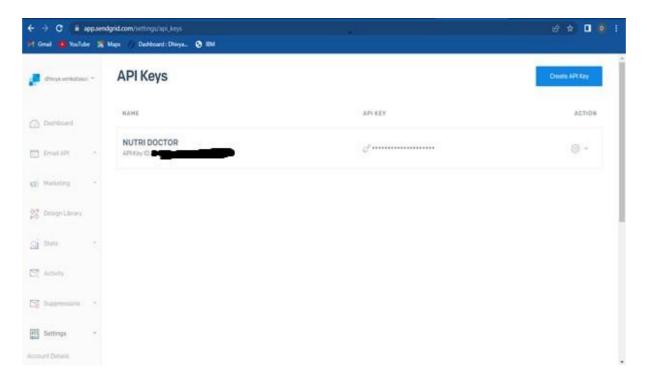

## STEP 1:

REQUIREMENTS:

PYTHON 2.6,2.7,3.4 OR 3.5

## **STEP 2:**

CREATE AN API KEY

# **STEP 3:**

INSTALL PACKAGE: > pipinstallsendgrid

#### **STEP 4:**

#### SEND EMAIL

```
### File Edit Selection View Co Run Terminal Selection (Part Selection View Co Run Terminal Selection View Co Run Terminal Selection (Part Selection View Co Run Terminal Selection View Co Run Terminal Selection (Part Selection View Co Run Terminal Selection View Co Run Terminal Selection (Part Selection View Co Run Terminal Selection View Co Run
```

#### **SENDGRID PYTHON CODE:**

```
1 import os
2 from sendgrid import SendGridAPIClient
  from sendgrid.helpers.mail import Mail
3
4
5 message = Mail (
6
       from email='from email@example.com',
7
       to emails='to@example.com',
8
       subject='Sending with Twilio SendGrid is Fun',
      html content='<strong>and easy to do anywhere, even with
   Python</strong>')
10 try:
11
      sg = SendGridAPIClient(os.environ.get('SENDGRID API KEY'))
12
      response = sg.send(message)
13
     print(response.status_code)
14
     print (response.body)
     print (response.headers)
15
16 except Exception as e:
17
     print (e.message)
```

# HTTP CLIENT PROGRAM

```
1 """HTTP Client library"""
2 import json
3 import logging
4 from .exceptions import handle_error
5
6 try:
7  # Python 3
8  import urllib.request as urllib
9  from urllib.parse import urlencode
10  from urllib.error import HTTPError
11 except ImportError:
12  # Python 2
```

```
17 _logger = logging.getLogger(__name_)
      def __init__(self, response):
          :param response: The return value from a open call
                           on a urllib.build opener()
          :type response: urllib response object
          self._status_code = response.getcode()

                   url path=None,
                   append_slash=False,
          :param host: Base URL for the api. (e.g.
  https://api.sendgrid.com)
          :type host: string
          :param request headers: A dictionary of the headers you want
```

```
applied on all calls
           :type request headers: dictionary
           :param version: The version number of the API.
                           Subclass build versioned url for custom
  behavior.
                           Or just pass the version as part of the URL
                           (e.g. client. ("/v3"))
           :type version: integer
           :param url path: A list of the url path segments
           :type url path: list of strings
          self.request headers = request headers or ()
           self. url path = url path or []
          self.append slash = append slash
          self.timeout = timeout
               Or just pass the version as part of the URL
104
               (e.g. client. ('/v3'))
            :param url: URI portion of the full URL being requested
            :type url: string
            return '()/v()()'.format(self.host, str(self. version),
  url)
110
        def build url(self, query params):
111
112
113
114
            :param query params: A dictionary of all the query
```

```
parameters
            :type query params: dictionary
            ur1 = ""
118
            while count < len(self. url path):
                url += '/()'.format(self._url_path[count])
121
122
123
124
            if self.append slash:
126
127
            query params:
                url values = urlencode(sorted(query params.items()),
130
131
132
133
                url = self._build_versioned_url(url)
134
135
136
137
138
        def update headers(self, request headers):
139
140
            :param request headers: headers to set for the API call
142
            :type request headers: dictionary
144
145
            self.request headers.update(request headers)
147
```

```
148
            :param name: Name of the url segment
           :type name: string
            url path = self. url path + [name] if name else
  self._url_path
                          request headers=self.request headers,
                          url path=url path,
                          append_slash=self.append_slash,
        def _make_request(self, opener, request, timeout=None):
            :param opener:
            :type opener:
            :param request: url payload to request
            :type request: urllib.Request object
            :param timeout: timeout value or None
            :return: urllib response
174
                return opener.open(request, timeout=timeout)
178
                 logger.debug('(method) Response: (status)
```

```
method=request.get method(),
                    status=exc.status code,
                    body=exc.body))
               (e.g. /your/api/(variable value)/call)
               Another example: if you have a Python reserved word,
190
              in your url, you must use this method.
            :param name: Name of the url segment
            :type name: string
195
196
        def getattr (self, name):
               (e.g. client.name.name.method())
               You can also add a version number by using
   .version(<int>)
            :param name: Name of the url segment or method call
204
            :type name: string or integer if name == version
               def get version(*args, **kwargs):
209
                   :param args: dict of settings
211
                    :param kwargs: unused
```

```
213
                    self. version = args[0]
215
216
                return get version
217
219
            if name in self.methods:
                method = name.upper()
                def http request (
223
                        request body=None,
224
                        query params=None,
                        request headers=None,
                        timeout=None,
227
229
                    :param timeout: HTTP request timeout. Will be
 propagated to
230
                        urllib client
231
                    :type timeout: float
232
                    :param request headers: HTTP headers. Will be
  merged into
233
                        current client object state
234
                    :type request_headers: dict
235
                    :param query params: HTTP query parameters
236
                    :type query_params: dict
237
                    :param request_body: HTTP request body
238
                    :type request body: string or json-serializable
239
                    :param kwargs:
240
241
242
                    ! request_headers:
```

```
243
                        self. update headers (request headers)
244
245
                    if request body is None:
                        data = None
